In fact, virtually any intellectual ability, academic task, popular game, or equipment can be incorporated into climbing activities, and many teachers have combined the activities with other subject matter, such as math and geography. The book contains dozens of activities and variations, including well-known games and those that incorporate numbers, letters, math, and words. Some games reinforce health concepts, such as nutrition and the MyPyramid food chart, muscles and exercise, human body systems (muscles and organs), human skeletal system, and appropriate health behaviors. All of the activities promote healthy, fun, and productive learning in which everyone can succeed. The ground-level and traverse activities will help your class meet NASPE standards So go encourage your participants to climb the wall! They'll encounter physical and intellectual challenges along the way, gain strength and confidence as they acquire new skills, and have loads of fun that is connected to learning. (MPB-11), Volume 11** *Princeton University Press* What is the minimum dimension of a niche space necessary to represent the overlaps among observed niches? This book presents a new technique for obtaining a partial answer to this elementary question about niche space. The author bases his technique on a relation between the combinatorial structure of food webs and the mathematical theory of interval graphs. Professor Cohen collects more than thirty food webs from the ecological literature and analyzes their statistical and combinatorial properties in detail. As a result, he is able to generalize: within habitats of a certain limited physical and temporal heterogeneity, the overlaps among niches, along their trophic (feeding) dimensions, can be represented in a one-dimensional niche space far more often than would be expected by chance alone and perhaps always. This compatibility has not previously been noticed. It indicates that real food webs fall in a small subset of the mathematically possible food webs. Professor Cohen discusses other apparently new features of real food webs, including the constant ratio of the number of kinds of prey to the number of kinds of predators in food webs that describe a community. In conclusion he discusses possible extensions and limitations of his results and suggests directions for future research.
